

Plant a refuge. Practice Insect Resistance Management

Reduce the potential risk of pest resistance to YieldGard Corn Borer and YieldGard Plus technology by planting a refuge that complies with Canadian Corn Pest Coalition and Canadian Food Inspection Agency guidelines.

When planting ALL YieldGard hybrids:

- Plant a minimum of 20% of your acres with non-Bt hybrids
- Never mix Bt and conventional seed
- If planting your refuge in strips, use a minimum of four rows per strip

When planting YieldGard Corn Borer hybrids:

- Plant your refuge within 400 meters (1/4 mile) of the Bt hybrids
- Do not use insecticides in the refuge to control European corn borer
- Plant Bt and refuge hybrids of similar maturity and at the same time

When planting YieldGard Plus hybrids:

- Plant your refuge adjacent to or within fields planted with Bt hybrids
- The refuge can be treated with insecticide to control corn rootworm
- Refuge and Bt planting areas should have the same crop rotation histories
